

P-values

Brian Caffo, Jeffrey Leek, Roger Peng

May 19, 2016

P-values

- ▶ Most common measure of “statistical significance”
- ▶ Their ubiquity, along with concern over their interpretation and use makes them controversial among statisticians
- ▶ <http://warnercnr.colostate.edu/~anderson/thompson1.html>
- ▶ Also see *Statistical Evidence: A Likelihood Paradigm* by Richard Royall
- ▶ *Toward Evidence-Based Medical Statistics. 1: The P Value Fallacy* by Steve Goodman
- ▶ The hilariously titled: *The Earth is Round ($p < .05$)* by Cohen.
- ▶ Some positive comments
- ▶ simply statistics
- ▶ normal deviate
- ▶ Error statistics

What is a P-value?

Idea: Suppose nothing is going on - how unusual is it to see the estimate we got?

Approach:

1. Define the hypothetical distribution of a data summary (statistic) when “nothing is going on” (*null hypothesis*)
2. Calculate the summary/statistic with the data we have (*test statistic*)
3. Compare what we calculated to our hypothetical distribution and see if the value is “extreme” (*p-value*)

P-values

- ▶ The P-value is the probability under the null hypothesis of obtaining evidence as extreme or more extreme than would be observed by chance alone
- ▶ If the P-value is small, then either H_0 is true and we have observed a rare event or H_0 is false
- ▶ In our example the T statistic was 0.8.
- ▶ What's the probability of getting a T statistic as large as 0.8?

```
pt(0.8, 15, lower.tail = FALSE)
```

```
## [1] 0.218099
```

- ▶ Therefore, the probability of seeing evidence as extreme or more extreme than that actually obtained under H_0 is 0.218099

The attained significance level

- ▶ Our test statistic was 2 for $H_0 : \mu_0 = 30$ versus $H_a : \mu > 30$.
- ▶ Notice that we rejected the one sided test when $\alpha = 0.05$, would we reject if $\alpha = 0.01$, how about 0.001?
- ▶ The smallest value for alpha that you still reject the null hypothesis is called the *attained significance level*
- ▶ This is equivalent, but philosophically a little different from, the *P-value*

Notes

- ▶ By reporting a P-value the reader can perform the hypothesis test at whatever α level he or she chooses
- ▶ If the P-value is less than α you reject the null hypothesis
- ▶ For two sided hypothesis test, double the smaller of the two one sided hypothesis test Pvalues

Revisiting an earlier example

- ▶ Suppose a friend has 8 children, 7 of which are girls and none are twins
- ▶ If each gender has an independent 50% probability for each birth, what's the probability of getting 7 or more girls out of 8 births?

```
choose(8, 7) * .5 ^ 8 + choose(8, 8) * .5 ^ 8
```

```
## [1] 0.03515625
```

```
pbinom(6, size = 8, prob = .5, lower.tail = FALSE)
```

```
## [1] 0.03515625
```

Poisson example

- ▶ Suppose that a hospital has an infection rate of 10 infections per 100 person/days at risk (rate of 0.1) during the last monitoring period.
- ▶ Assume that an infection rate of 0.05 is an important benchmark.
- ▶ Given the model, could the observed rate being larger than 0.05 be attributed to chance?
- ▶ Under $H_0 : \lambda = 0.05$ so that $\lambda_0 100 = 5$
- ▶ Consider $H_a : \lambda > 0.05$.

```
ppois(9, 5, lower.tail = FALSE)
```

```
## [1] 0.03182806
```
