# Statistical Inference Content

- ▶ Basic probability
- ▶ Likelihood
- ▶ Common distributions
- ▶ Asymptotics
- ▶ Confidence intervals
- ▶ Hypothesis tests
- ▶ Power
- ▶ Bootstrapping
- ▶ Non-parametric tests
- ▶ Basic bayesian statistics

## Example

Suppose that the proportion of help calls that get addressed in a random day by a help line is given by

$$f(x) = \begin{cases} 2x & \text{for } 1 > x > 0 \\ 0 & \text{otherwise} \end{cases}$$

Is this a mathematically valid density?

# The normal distribution

- ▶ A random variable is said to follow a **normal** or **Gaussian** distribution with mean  $\mu$  and variance  $\sigma^2$  if the associated density is

$$(2\pi\sigma^2)^{-1/2}e^{-(x-\mu)^2/2\sigma^2}$$

If  $X$  a random variable with this density then  $E[X] = \mu$  and  $Var(X) = \sigma^2$

- ▶ We write  $X \sim N(\mu, \sigma^2)$
- ▶ When  $\mu = 0$  and  $\sigma = 1$  the resulting distribution is called **the standard normal distribution**
- ▶ The standard normal density function is labeled  $\phi$
- ▶ Standard normal RVs are often labeled  $Z$

## Example bootstrap code

```
B <- 1000
n <- length(gmVol)
resamples <- matrix(sample(gmVol,
                           n * B,
                           replace = TRUE),
                    B, n)
medians <- apply(resamples, 1, median)
sd(medians)
[1] 3.148706
quantile(medians, c(.025, .975))
      2.5%      97.5%
582.6384 595.3553
```
